Section 3.5

IP Version 6

3.5.1 IPv6 - IP Version 6

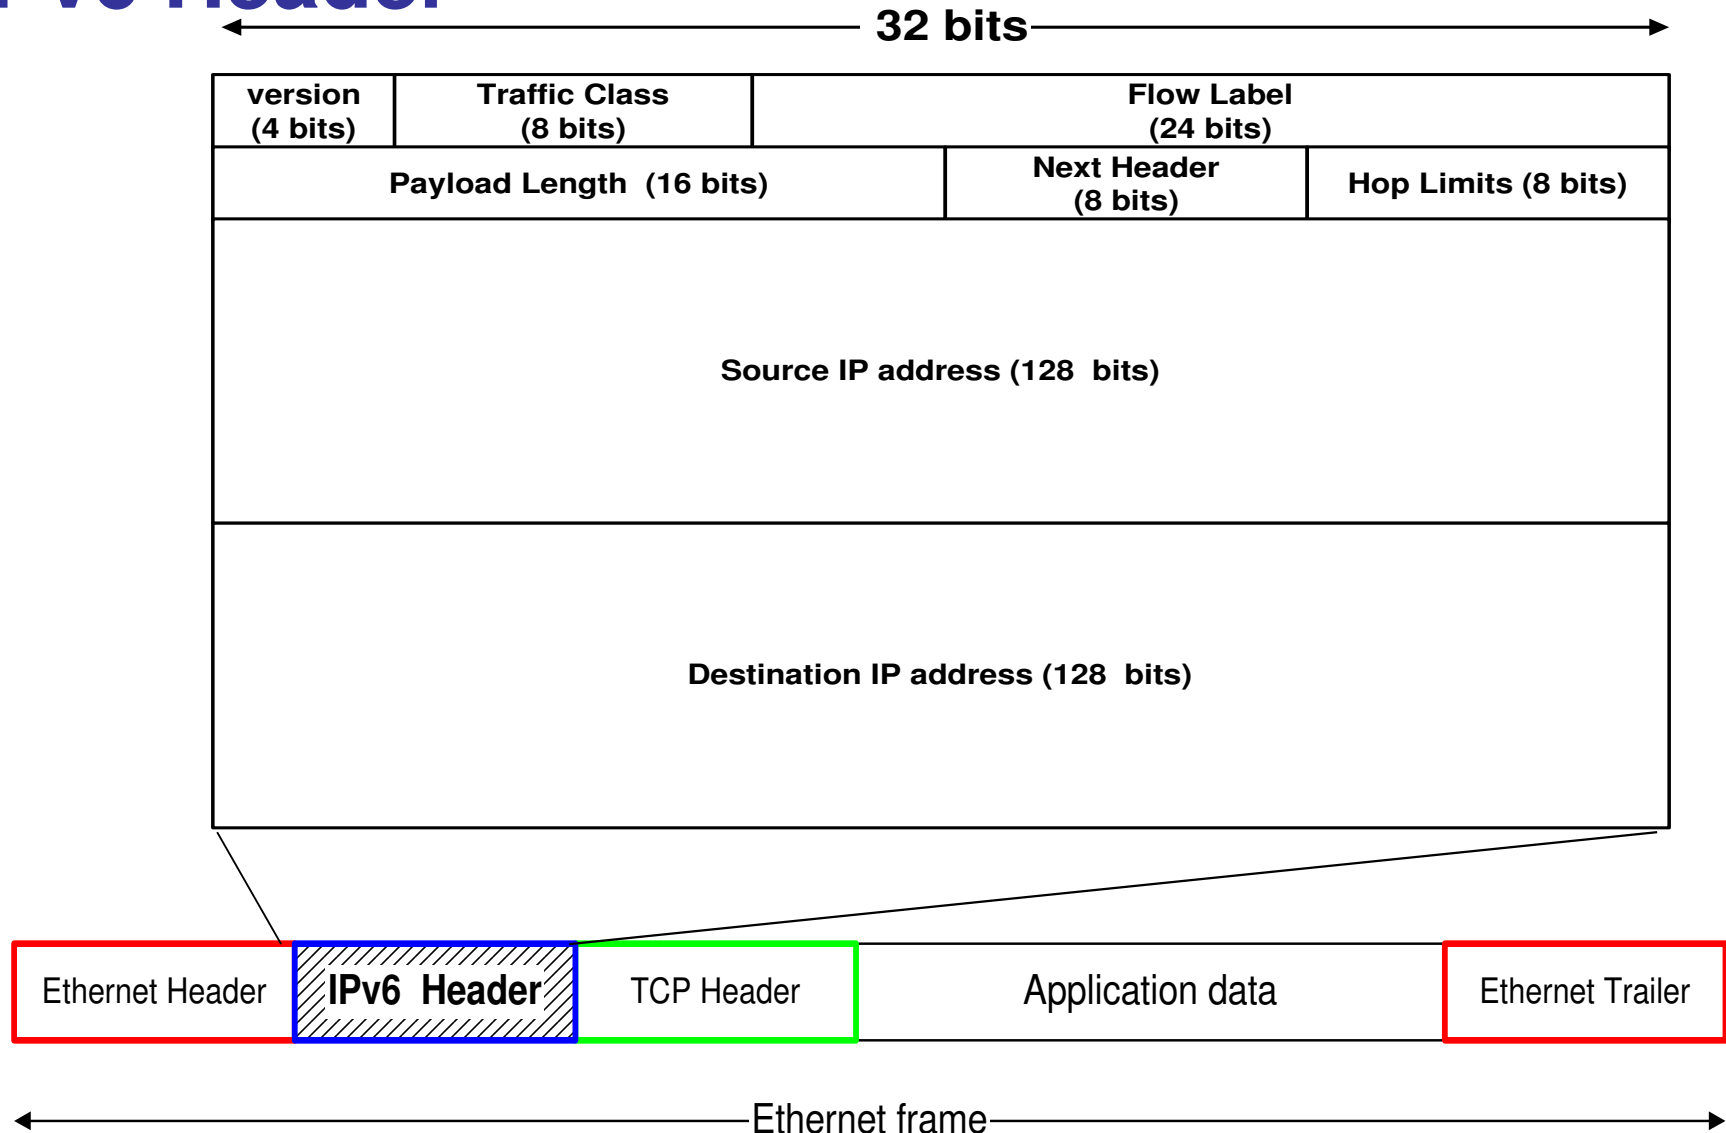

❑ IP Version 6

- Is the successor to the currently used IPv4
- Specification completed in 1994
- Makes improvements to IPv4 (no revolutionary changes)

❑ One (not the only !) feature of IPv6 is a significant increase in of the IP address to **128 bits (16 bytes)**

- IPv6 will solve – for the foreseeable future – the problems with IP addressing
- 10^{24} addresses per square inch on the surface of the Earth.

IPv6 Header

Notation of IPv6 addresses

- ❑ **Convention:** The 128-bit IPv6 address is written as **eight 16-bit integers** (using hexadecimal digits for each integer)

CEDF:BP76:3245:4464:FACE:2E50:3025:DF12

- ❑ **Short notation:**

- ❑ Abbreviations of leading zeroes:

CEDF:BP76:0000:0000:009E:0000:3025:DF12

→ CEDF:BP76:0:0:9E :0:3025:DF12

- ❑ “:0000:0000:0000” can be written as “::”

CEDF:BP76:0:0:FACE:0:3025:DF12

→ CEDF:BP76::FACE:0:3025:DF12

- ❑ IPv6 addresses derived from IPv4 addresses have 96 leading zero bits. Convention allows to use IPv4 notation for the last 32 bits.

::80:8F:89:90 → ::128.143.137.144

3.5.2 IPv6 vs. IPv4: Address Comparison

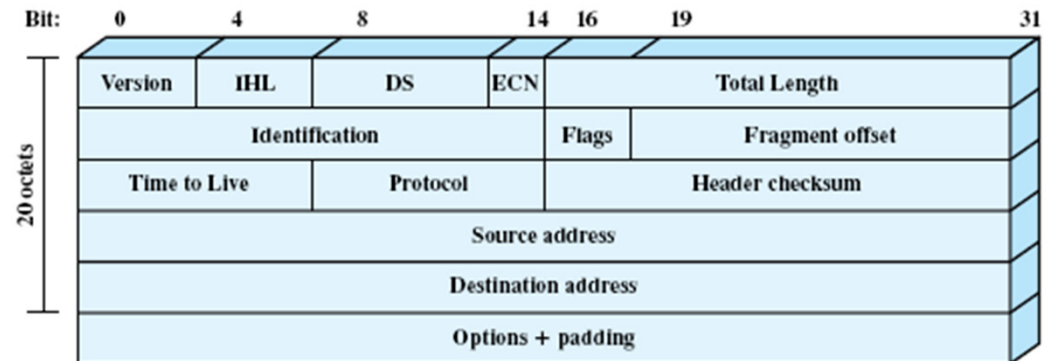

❑ **IPv4** has a maximum of

- $2^{32} \approx 4$ billion addresses

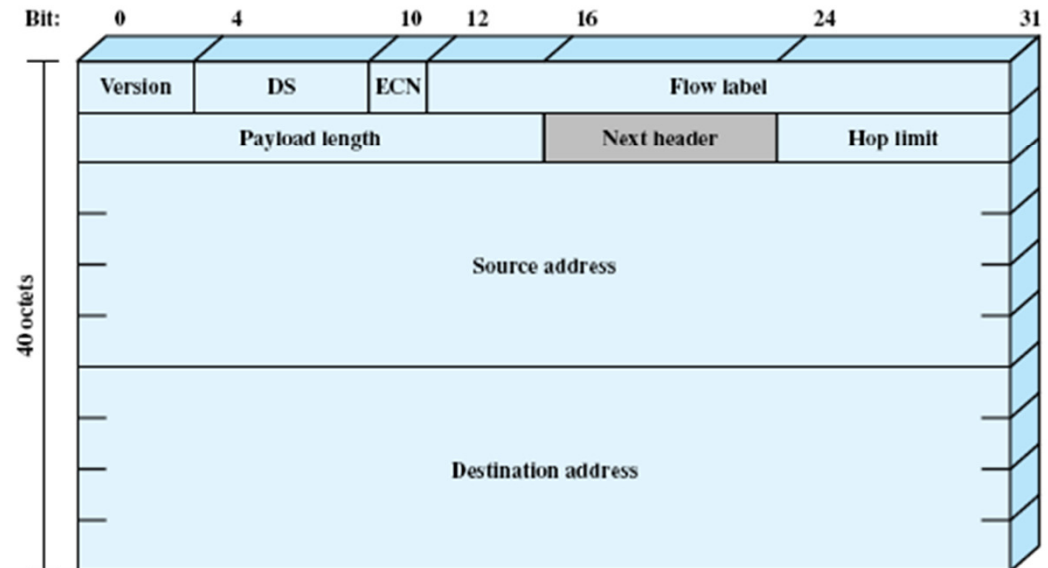

❑ **IPv6** has a maximum of

- $2^{128} = (2^{32})^4 \approx 4 \text{ billion} \times 4 \text{ billion} \times 4 \text{ billion} \times 4 \text{ billion}$ addresses

IPv6 vs. IPv4 cont.

(a) IPv4 header

(b) IPv6 header

DS = Differentiated services field
ECN = Explicit congestion notification field

Note: The 8-bit DS/ECN fields were formerly known as the Type of Service field in the IPv4 header and the Traffic Class field in the IPv6 header.
